

2000

Sewer Vertical Vent Valve

The 2000 series is a radical new concept in sewer vent design. The dual action system prevents inflow of water in a flood event, while preventing overflow of sewage back into the environment. This is especially important in areas where sewer out-fall lines run next to rivers and streams. The overflow of sewer collection lines would be devastating to the quality of the water and surrounding land.

- Restricts inflow
- Prevents overflow
- Powder coated for long lasting protection

Easy to access for cleaning, replacement parts, and inspection

Available as a 4" with a flanged connection
