

136 DECK DRAIN

Wager's standard deck drain is our 136 model. Available in either steel or aluminum, these drains are cast to our specifications, and are either galvanized or anodized for added protection against the harsh sea environment. Each drain has a removeable strainer plate secured by three stainless steel flat head screws. All of our strainer plates are also cast to allow for extra thickness and strength on deck. All deck drains are available upon request with a highly polished strainer plate for the yachting industry.

The 136 series is a 2:1 ratio deck drain to allow for additional drainage. Cast in galvanized steel, it has a heavy-duty cast bronze strainer plate for added strength on deck.
